PROJECTS

Senior Project:
Online Thrift Shop:
Complete website (Front end / Back end):
The goal of this website is to better facilitate the process of ordering used and thrifted clothes. This comes as help for the new Lebanese generation to find the style that best fits them easily, efficiently, and less expensively. Additionally, the website helps thrift shop owners find a new market and gain a new way of promoting themselves on a more professional scale which will inevitably be reflected in an increase in sales and profits. Additionally, using thrifted, secondhand clothing, lessens the amount of fabric in being thrown away in landfills, which assist in the reduction of wastes and land pollution. Study: HTML, CSS and JavaScript used for developing the frontend. PHP, PHP my admin and SQL for the backend part of the project.

Car rental system:
System for car renting that helps the owner to reserve, search for available, check reentered cars and update, delete new and old cars using structured C.
